**DESCRIPTION****Carbon removal through industrial pyrolysis technology**

We sequester atmospheric carbon into biochar and put that valuable carbon to use: in healthy, fertile soil, blue green infrastructure to substituting fossil carbons in circular economy concepts. Through biochar we actively remove carbon from the atmosphere by converting high volumes of biogenic residues into sustainable carbon removal on an industrial scale.

Once incorporated into soil the carbon it contains is removed from the natural cycle for centuries: The most stable and safest CO<sub>2</sub> sink and the only commercially proven Carbon Capture & Storage (CCS) technology becomes reality.

**[NovoCarbo GmbH](#)**

The NovoCarbo GmbH leverages a breadth of knowledge and experience to lead the way to develop a strong and sustainable biochar industry. As a leading operator of pyrolysis plants and an international trading platform for biochar and its derivatives NovoCarbo Group draws from an extensive network of strong partnerships and collaboration with research institutions to push the frontiers in biochar applications.

Our highly customizable biochar solutions can be used across a number of industries, as soil amendment, in water treatment and as an additive to decarbonize industrial products such as textiles or sustainable building materials. We provide biochar solutions to various green city projects and construction sites throughout Europe.

**[CARBO CONTROL](#)**

We help companies to reduce their carbon footprint: With our brand CARBO CONTROL we provide a turnkey solution for industries to integrate pyrolysis in existing industrial productions with the ultimate goal to reintegrate biochar into the existing value chain. CARBO CONTROL prepares and equips our customers with the knowledge, the equipment, infrastructure and removal certificates in order to create circular material and resource cycles towards carbon neutral operations.

**[SWISS BIOCHAR](#)**

With our company SWISS BIOCHAR we bring 10 years of experience in the development of high-performance substrates. Here we refine our biochar with a scientifically proven high-quality process for green/blue infrastructure and agriculture applications which can be tailored to the customers' needs.

NOVOCARBO GROUP's goal is to actively participate in the mitigation of climate change. We are constantly striving to gather and generate new vital knowledge in regard to products, market dynamics and development.

**CARBON REMOVAL INFORMATION**

**Reduce to the best, remove the rest!**

**Price 250 € / CORC**

<b>Carbon removal method :</b>	Biochar
<b>Capture of CO2:</b>	Photosynthesis
<b>Stabilization of CO2:</b>	Pyrolysis
<b>Stabilization of CO2:</b>	Pyrolysis
<b>Permanence:</b>	Over 1000 years
<b>Status of production:</b>	Audited
<b>Unit of product volume:</b>	tonne
<b>Embodied carbon in product:</b>	2.94
<b>Year of first issuance:</b>	2021
<b>Examples of usage:</b>	

Biochar for soil remediation and amendment in agricultural applications, as feed additive and bedding for livestock – through our exclusive partnership with [Beiselen](#), one of Germany's largest agricultural retailers

Biochar for wastewater and stormwater treatment

Biochar as additive/filler material for industrial composite materials such as concrete & high-performance polymers

Biochar as additive/amendment for high-performance substrates – through Swiss Biochar, Europe's oldest biochar company recognized for their Swiss Terra Preta products, see also [Skanska City Project](#)

**Co-benefits:**

**Reduce to the best, remove the rest!**

**Price 250 € / CORC**

The incorporation of the material into industrial value chains allows for compensating CO<sub>2</sub> emissions by insetting

Our manufacturing process technology is state of the art. Once activated, the autothermal process nearly runs on its own and requires just marginal additional energy input which we source from renewable energies, resulting in a CO<sub>2</sub> negative production process. Excess heat and energy are fed into the grid.

With our biochar we improve CO<sub>2</sub> balances of products with distinctively tailoring and incorporating our materials into products.

Our process ensures the highest product quality and integrity through compliance with internationally accepted standards such as the European Biochar Consortium (EBC) standard.

Biochar added to compost results in methane reductions during the process.

It further reduces nitrous oxide emissions, nitrate, and phosphorus leakage, helps reducing the utilization of mineral fertilizers and therefore protects water, soil and boosts biodiversity.

You want to explore biochar? Let us help you finding the best biochar solution for your application together with our highly proficient expert team.

**Economic acceleration  
impact:**

The benefits and possibilities of biochar need to be diffused among different sectors.

The first goal is to further promote its ecological value and capabilities and use the additional revenue from voluntary compensation certificates to subsidize the prices for biochar and in this way enable further application.

Secondly, the additional monetary resources will allow us to increase our R&D activities towards more possibilities for insetting practices based on pyrogenic carbon capture and storage (PyCCS) technologies.

Finally, we will be able to scale up our production facilities and increase our reach.

The biochar industry needs to expand, it needs to grow to have an even greater impact on climate mitigation. The overall purpose is to remove as much carbon as possible among all sectors and branches.
