Biochar

On demand

Durability

CORC 100+

Production facility country

Peru

Description

Inkan Negro began operations in 2014 as a research center that aimed to move biochar out of academia into the real world, where it could generate what the planet needs: change that matters. Inkan Negro produces biochar from municipal green waste and agricultural residues, such as cacao and coffee biomass. We engineer production technologies that are appropriate for operation in the global South and develop biochar formulations that address soil-crop constraints, whether for carbon insetting or offsetting purposes.

Co-benefits

Climate change mitigation

Improved management of waste biomass

Optimized agricultural yields

remediation of degraded and / or contaminated soils

co-generation of heat energy

Sustainable development goals

Disclaimer

Only SDG 13 has been assessed according to the Puro Standard SDG Assessment Requirements and validated and verified by a VVB.
