OUTPUT AUDIT REPORT

Company: Net-Zero Richardton LLC	Company Contacts: Jodi Johnson, CFO	Audit Team: * Bill Chatterton Kelly Inder-Nesbitt
Removal Method: Geologically Stored Carbon		
Report Date: November 27, 2025		
Document No: 350VR-NZ-PU2510_Q3-2025		
Rev: v2.0		

* primary contact/lead author

1. Introduction

350Solutions, Inc. was contracted to perform an audit of carbon dioxide removal credit (CORC) claims for Net-Zero Richardton LLC geologically stored carbon process. 350Solutions declares that we are an impartial auditor, free from any conflicts of interest, capable, and qualified to complete this audit according to Puro Standard and related Validation and Verification Body Requirements.

In June 2023, 350Solutions conducted a Production Facility audit of the process, lifecycle CO₂ emissions assessment (LCA), and other administrative details to verify compliance with the requirements of the Puro.Earth Puro Standard General Rules (Version 3.1) and Geologically Stored Carbon Methodology (Edition 2021) [1], [2]. The Production Facility audit (conducted while the facility was under ownership of Red Trail Energy (RTE)) remains valid until June 2027. This follow-up output audit was conducted to verify reported CORCs from the facility under new ownership of Gevo Inc. for the period of July 1st, 2025 - September 30th, 2025.

350Solutions reviewed the change in ownership from RTE to Gevo, Inc. and confirmed that Net-Zero Richardton LLC retains all rights to the CORCs generated during and after the ownership transfer, as outlined in Gevo’s ownership clarification documents. Formal notification to the Department of Mineral Resources - Oil and Gas Division notifying them of the change in ownership was also provided for review during the audit. The audit and verification included a detailed document review and audit beginning November 11, 2025

Table 1: Output Audit Summary

Verification Summary	
CO₂ Removal Supplier	Net-Zero Richardton LLC
Removal Method	Geologically Stored Carbon
Verification Type	Output Audit; Puro Standard General Rules (v3.1) and Geologically Stored Carbon Methodology (Edition 2021)
Production Facility Name and Registry	Gevo North Dakota Facility ID: 353054
Production Facility Locations	3682 Hwy 8S, Richardton, ND 58652 Lat 46.883, Long -102.313
Crediting Period	June 30, 2022 – June 29, 2027
Reporting Period	July 1, 2025 – September 30, 2025
Supplier Claimed CORCs	42,631 tonne CO ₂ -eq
Verified CORCs	42,631 tonne CO ₂ -eq
CORC Factor (net removed/gross stored)	0.998

Audit Kickoff Date	November 11, 2025
Audit Report Date	November 27, 2025

2. Technology Description

Gevo, Inc. owns and operates Net-Zero Richardton (NZR) ethanol production plant and Richardton CCS (RCCS) carbon capture and storage facility near Richardton, North Dakota. The plant complex is situated inside a footprint of approximately 25 acres of land which is part of an approximately 135-acre parcel. The plant was placed into service in January 2007 and can produce more than its name-plate production capacity of 50 million gallons of ethanol per year. NZR uses corn as feedstock to produce ethanol at the plant.

The combined NZR and RCCS facilities are designed to ultimately inject about nominal 180,000 tonnes CO₂ annually more than a mile below facility property for permanent storage. In partnership with the North Dakota Industrial Commission Renewable Energy Program and the U.S. Department of Energy (DOE), the RCCS CCS Project was determined a technically viable option for the significant reduction of CO₂ emissions from ethanol production. The project was also supported by the Energy & Environmental Research Center -led Plains CO₂ Reduction (PCOR) Partnership <https://pcor.undeerc.org/>.

The process is summarized in Figure 1.

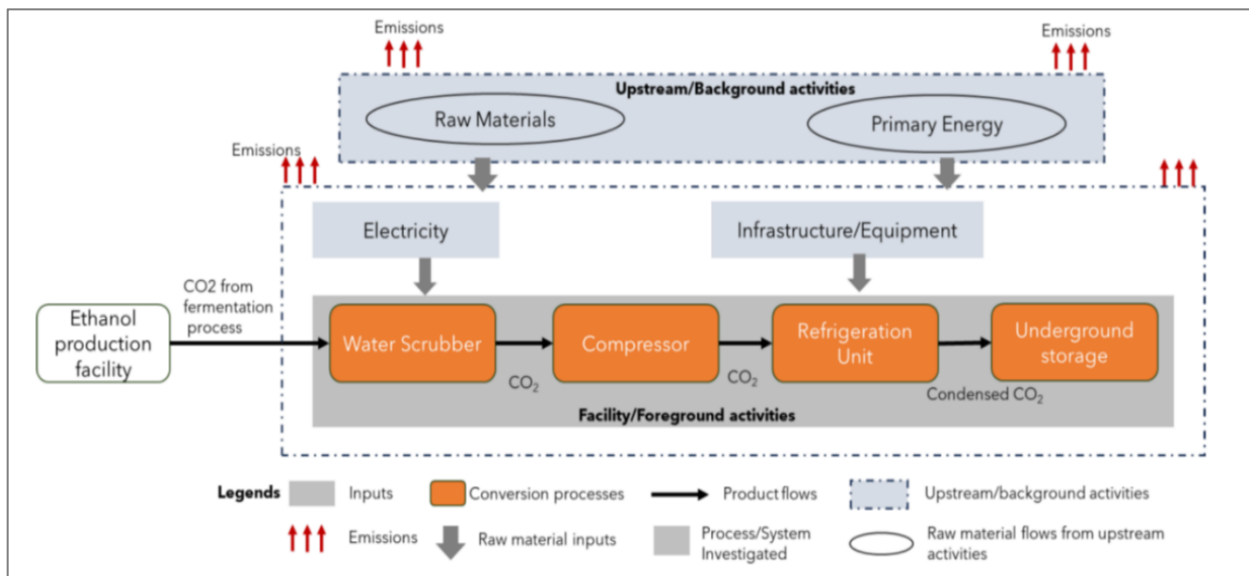

Figure 1: RCCS Facility Process

2.1. Process Inputs & Outputs

The system boundary for the RCCS process starts at the gate of the CO₂ processing facility, first treating the exhaust gas received from the ethanol plant. The ethanol production facility is outside of the system boundary considered for this project. Furthermore, the LCA is carried out considering both (a) upstream or background systems, which are responsible for producing and supplying raw materials (e.g., equipment, infrastructures, fuels) to the CCS-facility, and (b) facility or foreground

systems, where actual processing of fermented CO₂ takes place and of which this evaluation is carried upon.

For geologically stored carbon CORCs, the functional unit is 1 kg of CO₂ captured and stored in a compliant storage site. The injected CO₂ is greater than 99.9% purity and contains some trace quantities of nitrogen and oxygen. The process uses electricity only for operation of equipment.

RCCS’s process produces very little to no waste products and has very limited emissions of any kind from the facility. Waste produced from the RCCS process (primarily water removed from the captured CO₂ stream) are recycled back to the fermentation process. There are no air emission points outside of process bypass equipment which is not used during normal operations. No bypass or venting events were recorded during the reporting period. All CO₂ capture is processed (water removal, trace organic and inorganic contaminant removal, compression, and liquefaction) and injected at the wellhead. Table 2 summarizes the observed inputs and outputs from the process and typical rates from supplied operational data.

Table 2: Verified Production Facility Inputs & Outputs

Input or Output	Item	Verified Amount Over Monitoring Period ¹	Notes (Specifications, source, etc.)
Inputs	Water	N/A	Water removed from captured CO ₂ ; recycled to fermentation process.
	Electricity use (Blowers, pumps, compressors, chillers, controls)	7,935 MWh (metered)	Utility revenue-grade metering. For Jul–Sept 2025 the grid electricity emission factor for North Dakota (eGRID MROW2023 920 lb/MWh ≈ 417 g/kWh) is replaced with wind REC factor 9.59 g/kWh from LCA ‘database’ sheet. Resulting CCS process emissions from electricity: 76.1 tCO ₂ e.
	Electrical and mechanical equipment, infrastructure, pipeline, monitoring and injection wells, controls ²	122.85 tCO ₂ e	Embodied emissions based on LCA emission factors (Ecoinvent v3.3.1 and GREET 2022 datasets).
Outputs	CO ₂ injected (C _{injected})	42,708 t CO ₂	Biogenic CO ₂ from fermentation captured and injected Jul–Sept 2025; measured at wellhead (dry basis).
	CCS process emissions ³	76.1 tCO ₂ e	From electricity consumption using wind REC factor 9.59 g/kWh per LCA spreadsheet ‘database’ sheet.

¹ CORC calculations are based on the net CO₂ emission rate determined and verified in the LCA for RCCS by EcoEngineers. The values of inputs during the reporting period are verified and reported here for completeness.

² The materials required for the wellbore construction are estimated based on the wellbore design. For the wellbore construction, carbon resistant cement is assumed as raw materials being used. As the EFs of such materials are not available, the EF of the Portland cement is assumed as a substitute data. Due to the lack of EF data for specific steel grades, generic steel production data for the U.S. is used for pipeline construction and skid production. For the wellbore tubing chromium steel 18-8 data is used in place of 13 Cr.80.

³ For the Jul–Sept 2025 grid electricity emission factor for North Dakota 417 g/kwh (eGRID MROW2023 920 lb/MWh) is replaced with wind energy 9.59 g/kWh.

3. Audit Summary

3.1. Audit Approach

A planned series of audit activities were conducted by 350Solutions to independently validate and verify production and output data, and CORC claims for the reporting period. The audit was conducted following the specifications of Puro General Rules (Version 3.1) and Geologically Stored Carbon Methodology (Edition 2021). Specific audit activities conducted are summarized in Table 3.

A completed Puro Geologically Stored Carbon Methodology Audit Checklist used during the audit is attached to this report as Appendix 1. Auditor qualifications are attached as Appendix 2.

Table 3: Audit Activities

Date(s)	Verification Activity	Verification Tasks	Documents Reviewed
November 11, 2025	Introductory Document Review	<ul style="list-style-type: none"> - Opening meeting and review of operational and procedural changes - Review of LCA and supporting documentation - Review of Puro CORC calculations - Review of product properties - Review of product end use 	<ul style="list-style-type: none"> - Audit Document Index - GSC.xlsx - Disclosure since last audit - Red Trail Energy.xlsx - RCCS Information Q3_7.2025-9.2025_v1.xls - Calibration Records.pdf - CO2 Sample Analysis April 2025.pdf - MRETS Retirement ID 00197560e-351f.pdf - puro_LCA_RCCS_Q3_2025_v1.xlsm

3.2. Verified Output & CORCs

Table 4 includes the specific CORCs claimed by Net-Zero for their Richardton facility during the reporting period, as well as the level verified by 350Solutions during data review.

Table 4: Verified CORCs for Gevo North Dakota – July 1, 2025-Sept 30, 2025

Performance Metric Name / Description	Verified Value	Data Sources	Reporting Period
Net CO₂ Removal Factor¹	-0.998 (with RECs + wind Scope 3) (embodied)		
CO₂ Captured (C_{injected})	42,708 tonne		
CCS Process emissions (E_{capture}, E_{transport}, and E_{injection})²	76.1 tonne CO _{2e}	<ul style="list-style-type: none"> - Q3 2025_RCCS_LCA Report_v1.pdf - puro_LCA_RCCS_Q3_2025_v1.xlsm 	July 1 – September 30, 2025
Emissions from construction of CCS equipment (E_{equipment})	0 (emissions already accounted for in previous auditing period)	<ul style="list-style-type: none"> - RCCS CO2 Tonnes Injected Q3_2025_v1.xls - Roughrider Electric July 2025 Invoice 	
CORCs	42,631 tonne CO _{2e}	<ul style="list-style-type: none"> - MRETS Retirement ID 00197560e-351f.pdf 	
CORCs Retired	37,528 tonne CO _{2e}		
CORCs available for VCM	5,103 tonne CO _{2e}		

¹Defined in LCA as carbon intensity (CI): as how many grams of carbon dioxide (CO₂) are released in the entire process of capturing and storing 1 kg of CO₂. A negative number means that carbon is removed/injected more than released/emitted.

²C_{loss} is defined as zero for the CCS process, with CO₂ flow monitoring conducted at the capture point (CO₂ capture at fermentation) and the wellhead injection point.

RCCS reports the amount of CO₂ injected each month to the North Dakota Industrial Commission (NDIC) for Class VI well compliance. During this reporting period, a total of **42,708 tonnes** of CO₂ was injected. To determine the net CO₂ removal, project emissions—**76.1 tonnes** of CO₂—are subtracted, resulting in **42,631 tonnes net CO₂ removal** which are eligible for issuance as Carbon Dioxide Removal Credits (CORCs).

The CORCs are allocated between two markets:

1. **Low Carbon Fuel Standard (LCFS) markets** – where CO₂ removal is linked to ethanol sales in jurisdictions with LCFS programs.
2. **Voluntary Carbon Markets (VCM)** – where the remaining bio-CCS carbon sequestration credits are available for sale.

Ethanol sales are tracked monthly and categorized based on whether they are sold into LCFS or non-LCFS markets. The percentage of ethanol gallons sold into each category is used to proportionally allocate CORCs.

During this reporting period:

- **37,528 tonnes** of CO₂ were allocated to LCFS markets and retired.
- The remaining **5,103 tonnes** of net CO₂ injected are available for the VCM.

These allocations, along with supporting sales records, were documented in the file “*RCCS CO2 Tonnes Injected_Q3_2025_v1.xls*” and were reviewed and verified during the audit.

4. Audit Findings

4.1. Summary of Audit Findings

350Solutions has reviewed and audited the documentation of the technology, the instrumentation, the procedures, performance and collected data and has found that the data presented in the Puro Audit Package:

Meets the requirements of the Puro General Rules V3.1 and Geologically Stored Carbon Methodology

Meets the requirements of the Puro General Rules V3.1 and Geologically Stored Carbon Methodology with minor modifications

Does Not Meet the requirements of the Puro General Rules V3.1 and Geologically Stored Carbon Methodology

350Solutions utilized a reasonable level of assurance in performance of the outputs audit. A summary of specific findings associated with each requirement of the Puro Standard and Geologically Stored Carbon Methodology and any identified issues with the audit are summarized below.

Table 5: Audit Findings

Puro Standard GSC Method. Section Ref.	Audit Verification Topic	Final Findings
1.1.	<i>Eligible Activity Type</i>	Acceptable – The site is suitable for geological sequestration of biogenic CO ₂ being injected in an NDIC compliant Class VI well.
1.2.	<i>Eligibility Requirements</i>	Acceptable – NZR is an LLC registered with the Puro Registry for the listing of CO ₂ removal Certificates (CORCs). They achieve this by sequestering biogenic CO ₂ from the ethanol production process that would otherwise be vented to the atmosphere. Biogenic CO ₂ fraction via carbon isotope (C14) results 99%. NZR has demonstrated conformance to the EU directive RED II as a 1 st generation ethanol plant. Environmental assessments and historical records confirm corn as feedstock, and that the associated agricultural land was never previously an area of high biodiversity value, nor did it transition from regions with high carbon stock. NZR has documented committal to disclose fossil energy consumption and maintain level or reduced fossil energy consumption over time.
1.3. 5.1.2 5.1.3	<i>CO₂ Removal Supplier</i>	Acceptable – NZR has contracts with biomass suppliers to demonstrate feedstock sustainability. The facility can record the mass of CO ₂ sequestered and demonstrate the mass injected. Facility maintains an NDIC permit showing that the Class VI UIC program meets or exceeds the stringency of the federal EPA Class VI program. The quantification of the CO ₂ is finalized by third-party CO ₂ purity analysis of representative injection gas samples.
2.	<i>Point of creation of the CO₂ Removal Certificate (CORG)</i>	Acceptable – Verified accurate monitoring of CO ₂ injection rates at point of removal. RCCS is the operator of the sequestration site and owner of the contracts for the carbon containing waste.
3.1	<i>Life-Cycle Analysis (LCA) Boundary</i>	Acceptable - The activity boundary includes all activities existing solely for the purpose of CO ₂ removal. The LCA boundary begins with the capture of the carbon containing wastes, includes emissions associated with all equipment and inputs utilized for CO ₂ processing and transport, proceeding to the injection site, includes all onsite operations energy usage and emissions, and monitoring of the wells. The upstream production of the carbon containing ethanol product is not included in the LCA since they are not produced for the purpose of sequestration. This reporting period saw the use of RECs being used.
3.2 4.3.3	<i>Activity emissions within the LCA boundary</i>	Acceptable – Onsite energy consumption associated with capture, compression, water removal, liquefaction, and transport to the wellhead is measured and recorded. All emission factors used for associated equipment and activities are lifecycle based, include cradle-to-grave considerations, and are estimated using GREET 2022 and Ecoinvent v3.3.1 databases.
3.3 4.2.1 – 4.2.5	<i>Feedstock emissions within the LCA boundary</i>	Acceptable – Feedstock emissions are associated with ethanol production and outside of the CCS boundary for CO ₂ capture and storage.
3.4	<i>Equipment/Facility emissions within the LCA boundary</i>	Acceptable – All emission factors used for associated equipment and activities are included in the LCA GREET 2022 and Ecoinvent v3.3.1 databases. Note that all equipment emissions were accounted for during the previous reporting period (June 2022 – July 2023).

3.5	<i>Emissions outside the LCA boundary</i>	Acceptable – Emissions associated with operations not purpose built for CO ₂ sequestration are outside the boundary.
4.1, 4.3.1, 4.3.2 4.4 5.2	<i>Net Negative LCA</i>	Acceptable - NZR has demonstrated an appropriate basis for CORCs according to the Puro Methodology. The LCA was completed and independently verified. The LCA utilizes appropriate system boundaries and results in a net negative LCA.
4.5	<i>Uncertainty assessment</i>	Acceptable - The Jul-Sep 2025 LCA report applies conservative point estimates from GREET 2022 and Ecoinvent v3.3.1 but does not include a quantitative uncertainty analysis or parameter uncertainty ranges. Activity data for CO ₂ capture, injection rates, and gas purity continue to be measured using high-quality procedures and best practices. Scenario comparisons (with/without RECs, with/without Scope 3) are presented. Given the demonstrated operational stability of the verified system and inherent high-level accuracy and stability of the primary process measurement (CO ₂ injection rate via calibrated coriolis meter), data quality is assessed as acceptable.
5.3	<i>Permanence</i>	Acceptable – The injection well and storage site are properly permitted and permit compliance demonstrated, including permanence and monitoring requirements (RCCS utilizes state permitted Class VI well for injection of liquid CO ₂).
5.4	<i>Evidence against double counting</i>	Acceptable – Attestations of NZR sole ownership of CO ₂ claims provided. No claims of ownership by other parties can be made. Carbon market allocations for ethanol sale compliance obligation claims are quantified, tracked, and reported.

Additional details regarding audit activities, documents reviewed, and observations during the audit process are summarized in Appendix 1.

4.2. Audit Issues

No audit issues are noted for the reporting period.

4.3. Recommendations for Improvement

No recommendations for improvement are noted at this time.

5. Revision History

Version	Date Issued	Noted Changes
Draft v1.0	November 14, 2025	Initial Draft
Draft v1.1	November 19, 2025	350Solutions internal QA review, minor edits
Draft v1.2	November 24, 2025	External review by Puro, minor edits
Final v2.0	November 27, 2025	Final issued report

Eligibility Checklist								
General Eligibility Requirements	Puro Geologically Stored Carbon Methodology - 2021 - (GSCM) 1.1 Eligible capture & storage types	The production facility is technologically capable of increasing geologically stored carbon stock by storing CO2 or other GHGs captured directly from atmosphere or from biogenic sources.	Y	2023 site observation of entire process in operation; Project_Plan_RTE_FINAL.pdf, System boundary-RTE-CCS_11102023.ppt, rte-capture-design-package - pipeline length.pdf, Puro_LCA Report RTE 2024_FINAL_A.pdf	Full tour of production facility including feedstock delivery, ethanol production, CO2 capture from fermentation process, CO2 processing and liquifaction, CO2 transport to well head, and CO2 injection.	NET-ZERO owns and operates an ethanol production plant near Richardton, North Dakota, placed into service in January 2007 and is capable of producing in excess of 50 million gallons of ethanol per year. The project captures CO2 generated by the fermentation process . Fermentation exhaust is cleaned using a water scrubber to produce a purity stream of CO2. From the scrubber CO2 exhaust is pressurized, dehydrated cooled, distilled and pumped through a flowline to an injection well onsite where it is sequestered permanently in the Broom Creek formation. The injected gas has high CO2 purity (greater than 99.9%) .		
		The production facility utilizes eligible geological storage type: A. Direct injection of CO2 into geological formations EPA Class VI or EU CCS); B. Injection of carbon containing substance in reservoir (EPA Class I, II); or C. Storage in oil and gas reservoirs as part of EOR+ (EPA Class II well storage with more CO2 injected than CO2e in oil extracted).	Y	Evidence of the permanent storage.doc, TITLE V PERMIT TO OPERATE - (Current).pdf, RTE Broom Creek Storage Facility Certificates signed 4.4.23.pdf, https://www.dmr.nd.gov/dmr/oilgas/ClassVI ,	Well heads were physically observed at the time of the site visit and permits/monitoring reports for the wells were supplied by NET-ZERO	NET-ZERO utilizes state permitted Class VI well for injection of liquid CO2, see "RTE 10 (WF 37229) – Class VI injection permit" and Form 15 RTE 10 signed 1.14.25		

	The production facility utilizes eligible carbon capture types: A. Direct air capture; B. Biogenic CO2 from combustion of biomass, bioliquids, or biogas (i.e. BECCS, bio-CCS); C. Biogenic CO2 fraction from incineration of biomass mixed with other substances; D. Biogenic CO2 from biogas upgrading process; E. Biogenic CO2 capture from oxidization of biogenic materials in industrial processes; or F. Biogenic carbon-containing substance.	Y	CO2 analysis constitutes from Scrubber 4-2-2019.pdf, Site observation of entire process in operation; Project_Plan_RTE_FINAL.pdf, System boundary-RTE-CCS_11102023.ppt, Puro_LCA Report RTE 2023_FINAL_A.pdf	Type F: Biogenic carbon-containing substance, ethanol production from corn feestock	Type F: Biogenic carbon-containing substance, ethanol production from corn feestock		
GSCM 1.2.2	Evidence of geological storage permanence - eligible geological storages are controlled by EU or US laws and authorities or following similar requirements as set out by those legislations (See Row 13)	Y	Evidence of the permanent storage.doc, TITLE V PERMIT TO OPERATE - (Current).pdf, RTE Broom Creek Storage Facility Certificate signed 4.4.23.pdf, https://www.dmr.nd.gov/dmr/oilgas/ClassVI ,	numerous studies underway by EERC and RITE in regard to monitoring the co2 plume. No updates for plume study at this time.

GSCM 1.2.4	Only biogenic CO2 source is counted if a mixed fossil-biogenic flue gas or similar mixed sources is used	NA	Project_Plan_RTE_FINAL.pdf, System boundary-RTE-CCS_11102023.ppt, Puro_LCA RedTrail_v2024.xls	Confirmed biogenic sourced CO2 from ethanol production only			
GSCM 1.2.5	The activities should do no net harm to environment, e.g. cause deforestation, loss of biodiversity or to society through loss of arable land and decreased food security, chemical emissions or health risks.	Y	Project_Plan_RTE_FINAL.pdf (Section 2.1), Evidence of the permanent storage.doc, TITLE V PERMIT TO OPERATE - (Current).pdf, https://www.dmr.nd.gov/dmr/oilgas/ClassVI ,		All processes located on NET-ZERO property, public outreach activiites completed, fully permitted by relevant jurisditctions, plant has been in production since 2007, and feedstocks are demonstrated sustainable.		
GSCM 1.3.1, 5.1.3	The CO2 Removal Supplier is capable of metering CO2e injected reliably and consistently via appropriate metering technology and C content of injected CO2 or biomass stream (see also Section 4)	Y	Project_Plan_RTE_FINAL.pdf (Section 3), Puro_LCA Report RTE 2024_FINAL_A.pdf, RCCS Information Q3_7.2025-9.2025_v1.xlsx , rte-capture-design-package - pipeline length.pdf	Coriolis meters audit and observation, purity analyses. Review of PFD and PID in design package doc	Mass flow of CO2 metering is verified acceptable. Measurements are taken at the well head daily. The readings are automatically recorded in a data management system that produces a production report with the readings. Purity testing of CO2 is conducted through off-site analysis of collected samples, on a quarterly basis. Laboratory is ISO 17025 accredited.		

	GSCM 1.3.1, 5.2	The CO2 Removal Supplier is capable of calculating the net CO2 removal using an appropriate lifecycle emissions approach, providing all calculation details, assumptions, and results reliably and consistently	Y	Project_Plan_RTE_FINAL.pdf (Section 3), Puro_LCA Report RTE 2024_FINAL_A.pdf, RCCS Information Q3_7.2025-9.2025_v1.xlsx	review corc calcs in LCA	LCA completed by EcoEngineering. All supporting data provided by NET-ZERO and verified by EcoEngineering for use in LCA. LCA approaches and calculations all reviewed and verified.		
	EU directive RED II	a. The only eligible type of 1st generation ethanol plants are the plants have produced 1st generation ethanol for a minimum of 5 years with the same feedstock and same land use. b. The 1st generation ethanol plant commits to disclose its fossil energy consumption for ethanol production and aim to maintain the same level or reduce the consumption over time.	Y	Project_Plan_RTE_FINAL.pdf (Section 3), Puro_LCA Report RTE 2024_FINAL_A.pdf, RCCS Information Q3_7.2025-9.2025_v1.xlsx	Acceptable	The land adjacent to NET-ZERO is agricultural land that has been farmed since at least 1972 based on direct aerial photography as noted in a Phase I Environmental Site Assessment report. Historical records confirm that the adjacent agricultural land was never previously an area of high biodiversity value, nor did it transition from regions with high carbon stock after January 2008. This meets the biomass sustainability requirement as per the EU directive RED II		

Production (Capture & Storage) Facility Checklist (Desktop, Verbal, or Site Visit Confirmation)								
Lifecycle Analysis / Activity Boundary for Net Negativity	Annex G - 3 (Lifecycle GHG Emissions Boundary & Method)	GHG emissions have to be assessed and reported following the LCA calculation principles of ISO, WRI or PAS2050	Y	puro_LCA_RCCS_Q3_2025_v1.xlsm	Viewed documentation and verified during remote audit	Verified conformant, used Oregon GREET carbon intensity values		
	GSCM 3.1	The activity boundary includes all activities existing solely for the purpose of CO2 Removal. These include the carbon capture, transportation and storing into the geological storages, and biomass cradle to gate if biomass is purpose-grown for carbon removal.	Y	puro_LCA_RCCS_Q3_2025_v1, RCCS CO2 Tonnes Injected Q3_2025_v1, RCCS Information Q3_7.2025-9.2025_v1	Viewed documentation and verified during remote audit	LCA boundaries start with the capture of CO2 from the ethanol fermentation process and includes CO2e for purification (water organic, and inorganic controls), compression, cooling, geologic injection, and site monitoring.		

GSCM 3.2, 3.3, 3.4	<p>Emissions within the activity boundary include:</p> <ul style="list-style-type: none"> - All activities related to capturing (e.g. capture, liquefaction), - transporting (e.g. through pipelines or by shipping) and - storing (e.g. intermediate storages, injection) of the CO2 - CO2 emissions resulting from these activities; - Purpose-grown biomass (e.g. emissions from cultivation, harvesting and transportation of the biomass cradle-to-gate) if the biomass is solely grown for CO2 removal purposes; - Purpose-built equipment and facilities (e.g. emissions from materials and construction), and; - Other activities that do not exist solely for the purpose of CO2 removal even if they are physically connected to carbon capture. 	Y	RCCS Information Q3_7.2025-9.2025_v1	Viewed documentation and verified during remote audit	LCA boundaries start with the capture of CO2 from the ethanol fermentation process and includes CO2e for purification (scrubber), compression, cooling, geologic injection, and site monitoring. There are no transportation related emissions within the project boundary. For this reporting period RECs were used to offset project emissions.		
PGR 2.1.4	<p>The Supplier has assessed all potential sources of leakage (i.e. increases in fossil emissions) outside of the project boundary but due to the development and operation of the project. Where identified, leakage sources are quantified and included in the LCA.</p>	Y	puro_LCA_RCCS_Q3_2025_v1, System boundary-RTE-CCS_11102023.ppt	LCA also accounts for alternative fates of the products such as spreading on crop land, disposal via landfill, etc.	No economic leakage associated with project. An ISO 31000 conformant screening level risk assessment (SLRA) was conducted to evaluate potential of subsurface leakage. This leakage assessment determined none of the pathways required corrective action and the probability of storage reversals are unlikely.		
GSCM 3.5	<p>The LCA boundary does NOT include any of the following:</p> <ul style="list-style-type: none"> - biomass cradle to gate if NOT purpose grown for carbon removal - emissions from any process creating biogenic carbon to be captured (e.g. waste treatment, bioenergy plant, biogas processing) that do not exist solely for the purpose of CO2 removal 	Y	Project_Plan_RTE_FINAL.pdf, LCA_RCCS_Q3_2025_v1, System boundary-RTE-CCS_11102023.ppt	Verified	All CO2 captured and stored by the supplier is byproduct of on-site ethanol fermentation process.		

Evidence of Quantification - Captured & Injected CO2	GSCM 4.2.2, 5.1.1	<p>In the case of direct air capture, the Supplier demonstrates that the origin of their CO2 is atmospheric by providing operational data records that are able to rule out other origins of the CO2.</p> <p>- Evidence should include directly measured process data indicating the amount of CO2 captured and the plant performance (i.e. CO2 capture efficiency or CO2 material balance)</p> <p>- evidence must demonstrate that the CO2 amount delivered by the DAC plant is not greater than the actual plant performance would allow.</p>	NA	NA	NA	NA		
	GSCM 1.2.3, 4.2.2, 3.3, 5.1.3	<p>In the case of biogenic CO2 capture, the biomass is documented as sustainable (e.g. meets the requirements of EU directive REDII for sustainable biomass or similar).</p> <p>Where applicable, the monitoring and verification of sustainable biomass is done according to the process determined by RED II directive or similar and as implemented by national authorities, or via similar process if in an area where RED II is not applied.</p>	Y	Project_Plan_RTE_FINAL.pdf (Section 2.1)	Purchase agreements with regional providers confirmed, copies available if required.	Biomass sourced from land adjacent to NET-ZERO, as agricultural land that has been farmed since at least 1972. Aligns with the sustainability standards set forth by the EU directive on land-use changes		

<p>GSCM 4.2.2, 5.1.2</p>	<p>In the case of biogenic CO2 capture, the Supplier utilizes radiocarbon isotope analysis (14C, C-14, Carbon-14) (C14) results based on ISO 13833 or ASTM D6866 methods demonstrating biogenic fraction of the captured CO2. - analysis is performed periodically or continuously - analysis is performed by qualified persons - analysis is performed using properly calibrated equipment - for facilities using multiple or variable carbon containing sources, samples should typically be completed for each source type and delivery</p> <p>Note: Capture via DAC is excluded from this requirement.</p>	<p>Y</p>	<p>CO2 analysis constitutes from Scrubber 4-2-2019.pdf, RTE CO2 Nov 21st 2023.pdf, and Email from Puro dated 2/16/2023: "The C-14 test is only needed when it is a mixed source of fossil and biogenic CO2." CO2 analysis constitutes from Scrubber 4-2-2019.pdf</p>	<p>All CO2 from ethanol production process. Biomass is not mixed with anthropogenic carbon.</p>	<p>radiocarbon isotopic analyses conducted by accredited laboratory (Isotech) March 2022. Ongoing periodic CO2 purity GC/MS analyses conducted on quarterly bases by accredited laboratory (Airborne Labs International, ISO 17025). Currently 7 sample analyses average CO2 = 99.95% with standard deviation 0.064</p>	<p>99.9</p>	<p>%</p>
<p>GSCM 4.2.4</p>	<p>For EOR+ applications, the CO2e in the extracted oil must be monitored and reported and deducted in the LCA from the total CO2 injected - evidence must be provided of accurate measurement of oil produced via EOR activity - evidence must be presented regarding total carbon content of the produced oil by appropriate analytical methods, using qualified laboratories and representative samples of produced oil</p>	<p>NA</p>	<p>NA</p>	<p>NA</p>	<p>NA</p>	<p>NA</p>	<p></p>
<p>GSCM 4.2.5, 5.2.2</p>	<p>The CO2 Removal Supplier has provided the total volume of CO2 captured or amount of carbon containing source (in kg and in kg CO2e) and supporting data and documentation. Quantification and Calculation Checklist - Output Audit								
Verified Calculated Values	GSCM 4.1	CORCs are calculated in accordance with the GSCM Methodology as CORCs (kgCO2e) = $C_{\text{captured}} - E_{\text{project}} - C_{\text{loss}}$	Y	puro_LCA_RCCS_Q3_2025_v1, RCCS CO2 Tonnes Injected Q3_2025_v1, RCCS Information Q3_7.2025-9.2025_v1	Etransport and Einjection, and Closs are assumed to be negligible (zero).	Documentation review of data collected through period 8/23 to 1/25. Methodology verified conformant to methodology	42,631 net tonnes CO2 injected	CORCs
	GSCM 4.4	C_{captured} = CO2 measured at the capture site (in kg CO2e). Eligible fraction is calculated following Sections 4.2.2-4.2.4. (see rows 34-38)	Y		capture stated as NA (all CO2 is from on-site fermentation), and reported as CO2 injected	42,708 gross	tonne CO2e	
	GSCM 4.4	$E_{\text{project}} = E_{\text{capture}} + E_{\text{transport}} + E_{\text{injection}} + E_{\text{equipment}}$	Y		includes compression, scrubbing, cooling, and injection energy, and embodied equipment emissions	Verified	76.1	tonne CO2e

GSCM 4.4	Ecapture = includes all emissions from Capture phase, including energy use in capture, compression, and liquefaction, emissions from purpose grown biomass sourcing and conversion (i.e. to bio-oil), emissions related to capture chemicals (sorbents) or membranes, and system maintenance and regeneration.	Y			Biogenic CO2 is acquired as waste in an as is form from existing fermentation processes, and does not include upstream LCA considerations	The alternative to sequestration is venting.	0.084	tonne CO2e emitted per tonne CO2e injected
GSCM 4.4	Etransport includes all emissions from transportation of captured CO2 from capture site to injection site, including those associated with vehicle fuel use, pumping energy, etc. Emission factors used should be documented and well accepted.	Y	NA		No transportation confirmed		included in Ecapture	kgCO2e
GSCM 4.4	Einjection should include all emissions associated with injection, such as energy use for compression, pumping, injection, or any intermediate related activities such as storage.	Y			Confirmed, power meters 202556, 201121, 210129, and 600097 dedicated to CCS operations	Power only, confirmed all relevant equipment included, power meter readings recorded monthly. Power meters are revenue grade utility meters owned and maintained by RoughRider Electric	included in Ecapture	kgCO2e
GSCM 4.4	Equipment should include emissions from construction and delivery of capture and injection equipment, and associated with production and delivery of materials used to manufacture such equipment. Such emissions may be calculated using documented emission factors for the construction and materials processes or via a cost-based emission factor and the equipment capital costs.	Y		puro_LCA_RCCS_Q3_2025_v1, RCCS CO2 Tonnes Injected Q3_2025_v1, RCCS Information Q3_7.2025-9.2025_v1	verified all CCS process equipment included	Estimated using GREET 2022 and ecoinvent v3.3.1	0	kgCO2e

	GSCM 4.4	$C_{loss} = C_{captured} - C_{injected}$ Carbon losses are accounted for in the CORC calculation. C_{injected} is the amount of carbon measured at the point of injection (for a single user / storage site or with separate injection wells and measurements at a multi user site). For a multi-user injection site where injected amount is not monitored directly or unambiguously (separate from other injections), C_{injected} may be calculated based on calculated losses during transportation and injection as $C_{captured} - C_{transport}(C_{efficiencylogistic})(C_{efficiencyinjection})$	Y		confirmed as no losses, coriolis meter at compression point invalid for certain periods	Verbal confirmation that losses are negligible	0	kgCO ₂ e
Calculation Details & Considerations	GSCM 4.3.1	Emissions from the Project is the sum of GHG emissions from the activity (geo-stored carbon) included within the activity boundary. Those are: direct emissions (scope 1 and 2) from capture, transport and injection as well as emissions from chemicals, membranes and purpose-built equipment including the construction and materials for the equipment.	Y	Puro_LCA Report RTE 2024_FINAL_A.pdf	No additional carbon sources witnessed.			
	GSCM 4.3.2	CO₂ losses are regarded as any difference between CO₂ captured (total in kgCO₂e) and CO₂ injected to storage (total in kgCO₂e) (see section 4.4 calculation parameters). See Row 56	Y		Remote audit, verbal confirmation			
	GSCM 4.3.3	All emissions from energy use are within the activity boundary and are accounted for when quantifying the net CO₂ Removal. Energy used for geo-stored carbon activities is not required to be 100 % carbon free.	Y		Remote audit, verbal confirmation			
Uncertainty Quantification	GSCM 4.5.1	If there is uncertainty in measurement of C_{CAPTURED}, C_{INJECTED} or C_{TRANSPORT} the lower end of the range is used in the quantification. Document uncertainty value and range.	N	wellhead Flow meter calibration certificate.pdf, CO ₂ Sample Analysis April 2025.pdf, Calibration Report 2024	Best practices used for measurement of C _{captured} and C _{injected}	Uncertainty analysis not completed. Recommended in future for completeness		

	GSCM 4.5.2	<p>If there is uncertainty in metering or analyzing the carbon content of carbon-containing substance biogenic fraction of the captured CO2 due to sampling or testing techniques, the lower end of the range is used in the quantification. Document the observed range or uncertainty</p>	Y	<p>wellhead Flow meter calibration certificate.pdf, CO2 Sample Analysis April 2025.pdf, Calibration Report 2024</p>	<p>Inherent measurement error, process variability, and overall uncertainty is very low.</p>	<p>Uncertainty analysis recommended in future for completeness</p>

Appendix 2: Verifier Qualifications

Supporting documentation, including verifier resumes, and verifier or corporate accreditations are also included in this appendix.

Verifier Qualifications

Company Name:	Net-Zero Richardton	
Date:	11/11/2025	
Verifier Name:	Bill Chatterton	
Company Name (where applicable):	350Solutions	
Verifier Contact Information:	bill@350solutions.com, 984-215-0585	
Verifier Address:	1053 E. Whitaker Mill Rd. Suite 115, Raleigh, NC 27604	
Verifier Scope of Activities:	Output Audit through review of key technology components, operational data, and documentation.	
Verifier Qualifications	Criteria Met?	Evidence / Notes <i>(note how the criteria was met, specific documents - resume/CV, publications, certifications, etc.).</i>
Verifier has relevant technical knowledge of the type of technology being evaluated and carbon removal processes in general		
A) Does Verifier have:		
1. An in-depth technical knowledge of the technology type under verification;	<input checked="" type="checkbox"/>	350Solutions is accredited to ISO/IEC 17020:2012 and ISO 14034 Environmental Technology Verification (ETV) as a Type A (third party) Inspection Body (ANAB Certificate Number: AI-2618). The technical scope of 350's accreditation includes verification of performance and environmental impact as it relates to design, materials, equipment, installation and operations of technologies in the categories of Energy, Clean Production and Process, and Air Pollution Monitoring and Abatement. As documented in 350Solutions' ETV Standard Operating Procedure (ETV QPM 350-223-03), and Quality Systems Procedures for verifier qualifications (QSP-350-005-02), 350Solutions conforms to the requirements of ISO 17020 Annex A with respect to verifier qualifications and procedures. These procedures and quality management programs are generally relevant to verification under the Puro.Earth General Standard. Note that verifications completed for Puro.Earth are not equivalent to ISO 14034 verifications.
2. Knowledge of specific risk areas associated with performance of such technologies (i.e. common failure points, performance issues, barriers to scaleup);	<input checked="" type="checkbox"/>	
3. Knowledge of the environmental implications related to the use of the technology from a life cycle perspective, such as impact of the technology on lifecycle CO2 emissions and carbon removal;	<input checked="" type="checkbox"/>	
4. Knowledge of relevant applicable test methods and standards for evaluating performance or impact of the technology;	<input checked="" type="checkbox"/>	
5. Knowledge of relevant calculation, modeling, and statistical methods in order to assess test results and calculations of performance metrics and uncertainty, as applicable;	<input checked="" type="checkbox"/>	
6. Knowledge of data quality and data validation approaches, including QA/QC procedures, for example.	<input checked="" type="checkbox"/>	
Verifier is a credible independent 3rd party		
B) Is Verifier:		
1. third-party body independent of the team registered for the Puro Earth CORCs;	<input checked="" type="checkbox"/>	350Solutions is accredited to ISO/IEC 17020:2012 and ISO 14034 ETV as a Type A (third party) Inspection Body. As documented in 350Solutions ETV Policy Manual (ETV QPM 350-200-03), 350Solutions conforms to the requirements of ISO 17020 Annex A with respect to impartiality for Type A inspections, pursuant to ISO 14034 activities.
2. Not directly involved in the design, manufacture or construction, marketing, installation, use or maintenance of the specific technologies submitted to Puro.Earth for verification, or represent the parties engaged in those activities.	<input checked="" type="checkbox"/>	
3. Not part of a legal entity that is engaged in design, manufacture, supply, installation, purchase, ownership, use or maintenance of the items inspected.	<input checked="" type="checkbox"/>	

William Chatterton
350Solutions
Senior Verification Manager

EDUCATION

B.S. Environmental Science, SUNY at Plattsburgh, 1982
A.A.S. Environmental Technology, Paul Smith College, 1979
Certified Measurement and Verification Professional (CMVP), 2019

OVERVIEW AND EXPERTISE

William Chatterton is an Environmental Scientist with over 30 years' experience in demonstration, evaluation, and performance verification of technologies addressing environmental issues, advanced energy production and use, and carbon removal. His skills include management, design, and execution of technology demonstration and verification projects, with particular expertise in measurement, reporting, and verification (MRV) of technology performance. He serves as a Senior Verification Manager at 350Solutions and manages projects and programs for commercial and government clients in these areas. During his previous 20 years at Southern Research Institute, Mr. Chatterton managed and supported programs designed to integrate, demonstrate, and evaluate technology performance in the advanced energy and environmental mitigation fields. Technology demonstrations and evaluations that he has been involved with include technologies designed to promote sustainable energy sources, increase energy use and efficiency, mitigate GHG and other emissions, and in most cases provide other social and economic benefits to potential users.

At 350Solutions, he has led efforts toward 350Solutions becoming the first US-based technology evaluation firm accredited to conduct Environmental Technology Verifications under the international standard ISO 14034 – an international standard issued in 2016 to unify the general approach for the evaluation of innovative technologies with potential beneficial impact on the environment.

Mr. Chatterton has had technical roles in several projects focused on identifying and evaluating carbon dioxide (CDR) removal technologies. Under these projects, he verifies the efficacy, performance, scalability, and sustainability of a range of carbon removal technological approaches. Each project culminated in verification statements and reports that summarized verification findings, presented verified performance data, and identified risks associated with broad implementation of the technologies.

PROFESSIONAL EXPERIENCE

350Solutions: 08-2019 – Present

Senior Verification Manager: In this role, Mr. Chatterton manages and executes technology performance demonstrations and verifications of emerging technologies including carbon removal, advanced energy, emissions mitigation, and transportation technologies for commercial clients and U.S. governmental agencies. These performance evaluations generally involve evaluation of commercial feasibility, economic impacts (installation, operating, and capital costs, simple payback, and return on investment), environmental impacts (primarily greenhouse gas and criteria pollutant emission reductions), and technology performance. He also manages and monitors 350Solutions' quality management programs and ISO accreditations.

Recently, he has led diligence and verification activities of CDR technologies for an advance market commitment consortium that aims to accelerate the development of carbon removal technologies by guaranteeing future demand for them. Under a recent project, he verified the efficacy, performance, scalability, and sustainability of two leading enhanced rock weathering (ERW) technologies in the Southern US.

He has also led or supported several technology verifications and performance audits of CDR technologies for one of the world's leading crediting platforms for engineered carbon removal. Technologies verified have included biochar, geologic storage, ERW, and carbonated materials CDR systems.

Previously, Mr. Chatterton served as lead verifier in support of the NRG-Cosia Carbon XPRIZE competition. Following ISO 14034 protocol, the performance of ten CO₂ capture and conversion technologies were independently evaluated and verified at pilot scale demonstrations while utilizing CO₂ in flue gas. His specific roles in supporting this project included review of technology specifications and commissioning, development of verification plans, field verification of performance, and development and submittal of ISO conformant verification reports and statement.

Southern Research Institute: 1999 - 2019

Program Manager, Energy & Environment Technologies: As Program Manager, Mr. Chatterton has managed and executed several technology performance demonstrations and verifications of emerging energy (efficiency and green building) and transportation technologies, primarily for U.S. governmental agencies, energy research associations, and state energy agencies. These performance evaluations have involved evaluation of commercial feasibility, economic impacts (installation, operating, and capital costs, simple payback, and return on investment), environmental impacts (primarily greenhouse gas and criteria pollutant emission reductions), and technology performance. He has also directed field tests at industrial or commercial sites of oil and gas extraction and processing, power generation, advanced energy, green building, and mobile source technologies. Technology performance assessments typically include management of multiple team efforts and result in peer reviewed deliverables such as test plans and reports and other outreach activities.

Project Manager: Managed projects for both private and governmental clients primarily in support of EPA's Environmental Technology Verification (ETV) Greenhouse Gas (GHG) Center. Technology demonstrations focused on energy efficient, GHG relevant, and environmentally sustainable technologies including advanced power generation systems (CHP and micro-CHP), fuel cells, the oil and gas industry, and transportation technologies (on- and non-road retrofits and emerging technologies). As a senior project manager at Southern, he has been involved with performance verification of numerous GHG mitigation technologies and several distributed generation electrical generators, many in NYS. His support of these verifications has included lead or technical support on test plan development, design and implementation of field-testing activities, data evaluation and presentation, and reporting of results. He has managed performance evaluations of four alternative energy cogeneration systems including microturbine, internal combustion, and fuel cell-based systems, all fueled with biogas. Under EPA's ETV Program, assisted with the formation of and participated in two Stakeholder Groups – The Oil and Gas Industry Stakeholder Group, and the Advanced Energy Stakeholder Group.

Kelly Inder-Nesbitt
Senior Carbon Removal Verification Engineer, 350Solutions

Education:

- Master of Science in Geography, Archaeology, and Environmental Studies, University of the Witwatersrand, 2014
- Bachelor of Science with Honors in Geography, University of the Witwatersrand, 2011
- Bachelor of Arts in Geography and Archaeology, University of the Witwatersrand, 2010

Experience Summary:

At 350Solutions, Kelly specializes in verifying carbon removal projects to ensure compliance with ISO 14034 standards and carbon registry requirements. With over a decade of experience in environmental compliance and carbon management, she brings extensive expertise in operational compliance and MRV framework implementation, enhancing accuracy, transparency and integrity in the voluntary carbon market.

Kelly's career spans multiple sectors, including aquaculture, mining, and carbon removal technology, where she has developed and audited environmental management systems that promote sustainable practices and attract investor finance. At 350Solutions, she leads the validation of diverse carbon removal pathways, including biochar, BECCS, DAC and direct ocean capture and biomass burial. Her responsibilities encompass site audits and rigorous evaluation of MRV systems to ensure scientifically validated project claims.

Previously Kelly led the development of Brilliant Planet's carbon dioxide removal methodology protocol for algal biomass burial and contributed as an author. She was also responsible for developing and implementing an ISO 14001 compliant EHSS Management System for the FirstWave Group, who are aquaculture industry leaders in Southern and Eastern Africa. This system is also aligned with IFC World Bank Best Practices and leveraged software tools to streamline compliance monitoring and enhance ESG reporting for investor and regulatory alignment.

Throughout her career, Kelly has consistently collaborated with project developers, communities, regulators, and clients to enhance the credibility of environmental initiatives through rigorous documentation and alignment with international standards. Her approach emphasizes precise data management and actionable reporting, elevating compliance practices into a strategic, value-adding process that drives sustainable business growth.

Kelly's strong communication skills and commitment to fostering collaboration enable her to manage complex compliance initiatives effectively. Her ability to bridge the gap between technical requirements and stakeholder expectations continues to advance science-driven, impactful solutions in the carbon removal industry.
